Ultraviolet (UV) designates a band of the electromagnetic spectrum with wavelength from 10 nm to 400 nm, shorter than that of visible light but longer than X-rays. UV radiation is present in sunlight constituting about 10% of the total light output of the Sun. It is also produced by electric arcs and specialized lights, such as mercury-vapor lamps, tanning lamps, and black lights.

The web address you are trying to reach is no longer in service. Possible reasons include: The URL uses ohio.edu instead of ohio.edu. Try retyping the address using ohio.edu. The destination page or service may have been moved.

The ohio.edu domain has been decommissioned | Ohio University

Introduction. With regard to the absorption of light, primary material considerations include: At the electronic level, absorption in the ultraviolet and visible (UV-Vis) portions of the spectrum depends on whether the electron orbitals are spaced (or "quantized") such that they can absorb a quantum of light (or photon) of a specific frequency, and does not violate selection rules.

The remarkable achievement by Fujishima and Honda (1972) in the photo-electrochemical water splitting results in the extensive use of TiO₂ nanomaterials for environmental purification and energy storage/conversion applications. Though there are many advantages for the TiO₂ compared to other semiconductor photocatalysts, its band gap of 3.2 eV restrains application to the UV-region of the ...

In this essay, we will briefly summarise the analysis in our three "Physics of the Earth's atmosphere" papers, which we have submitted for peer review at the Open Peer Review Journal.. In Paper 1, we developed new analytical techniques for studying weather balloon data.
