Its easy to find bolt sheer and pull out data, but I am having a hell of a time finding one for female threads in various materials (steel, Al, etc.) Basically I am looking for the difference in pull out for a 1/2-13 in 1/2" steel plate \*against\* 1/2-13 in 3/4" steel plate. I am basing both on a 80%

Since no gain device does a perfect job of approximating a resistor, various techniques have been developed

over the years to make them more linear.

An amount of labor. Workload is the amount of work an individual has to do. There is a distinction between the actual amount of work and the individual's perception of the workload. Workload can also be classified as quantitative (the amount of work to be done) or qualitative (the difficulty of the work).

Load cells are constructed using electric resistance metal foil strain gages bonded to an elastic flexure element. The load cell is a passive analog device with continuous resolution limited ultimately by noise, due to electron motion on the order of 10<sup>-9</sup> volts (1 nanovolt).

Another thing to remember is the gate capacitance. So, when the MOSFET is to be turned on or off, the gate must be driven high or low with sufficient current quickly enough so as to charge or discharge the gate capacitance quickly enough so that the MOSFET spends minimal time in the linear region and is quickly turned fully on or off.
