Plate tectonics (from the Late Latin tectonicus, from the Greek: *τέκτωνικός*, *téktonikós*, "pertaining to building") is a scientific theory describing the large-scale motion of seven large plates and the movements of a larger number of smaller plates of the Earth's lithosphere, since tectonic processes began on Earth between 3 and 3.5 billion years ago. The model builds on the concept of continental ...

To a large extent, the early work in plate tectonics was provoked by startling new geophysical observations coming out of the U.S. Navy's newfound Cold War interest in the oceans, where the topographic and magnetic effects of plate interactions happen to be the clearest, and where some 80% of the planet's plate boundaries happen to reside, and

The mantle is a layer inside a planetary body bounded below by a core and above by a crust. Mantles are made of rock or ices, and are generally the largest and most massive layer of the planetary body. Mantles are characteristic of planetary bodies that have undergone differentiation by density. All terrestrial planets (including Earth), a number of asteroids, and some planetary moons have mantles.

Kimberlite magmatism has occurred in cratonic regions on every continent. The global age distribution suggests that this form of mantle melting has been more prominent after 1.2 Ga, and notably between 250–50 Ma, than during early Earth history before 2 Ga (i.e., the Paleoproterozoic and Archean).

Recycling of crust into the deep mantle may not require plate tectonics. Rocks formed during zircon age valleys do not differ from those formed during age peaks.

The Deccan Traps and Reunion hotspot track are well explained as melting of delaminated, recycled continental mantle lithosphere and a propagating crack.

Earth's history should include 'pre-plate tectonic' and 'plate tectonic' phases beginning less than a billion years ago, according to a team of geoscientists in the journal *Geology*.

Amnesic shellfish poisoning (ASP), also known as domoic acid poisoning (DAP) because amnesia is not always present, was first recognised in 1987 in Prince Edward Island, Canada.

The D&D Basic Rules document is divided into three parts. Part 1 is about creating a character, providing the rules and guidance you need to make the character you™ play in the game. It includes information on the various races, classes, backgrounds, equipment, and other customization options that you can choose from.

One of the very foundations of evolution and popular science today is the "geologic column." This column is made up of layers of sedimentary rock that supposedly formed over millions and even billions of years.
