The matrix for a reflection is orthogonal with determinant $\hat{=}$ 1 and eigenvalues $\hat{=}$ 1, 1, 1, ..., 1. The product of two such matrices is a special orthogonal matrix that represents a rotation. Every rotation is the result of reflecting in an even number of reflections in hyperplanes through the origin, and every improper rotation is the result of reflecting in an odd number.

Students further explore functions, focusing on the study of linear functions. Students develop understanding of the connections between proportional relationships, lines, and linear equations, and solve mathematical and real-life problems involving such relationships.

In addition to being irrational, more strongly \sqrt{e} is a transcendental number, which means that it is not the solution of any non-constant polynomial equation with rational coefficients, such as $x^5 / 120 \hat{=} x^3 / 6 + x = 0$. The transcendence of \sqrt{e} has two important consequences: First, \sqrt{e} cannot be expressed using any finite combination of rational numbers and square roots or n-th roots such ...
