A Tutorial on Multivariate Statistical Analysis

As in univariate logistic regression, let $\pi(x)$ represent the probability of an event that depends on p covariates or independent variables. Then, using an inv. logit formulation for modeling the probability, we have: $\pi(x) = \frac{e^{\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_p X_p}}{1 + e^{\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_p X_p}}$ So, the form is identical to univariate logistic regression, but now with more than one covariate.

(logistic regression makes no assumptions about the distributions of the predictor variables). Logistic regression has been especially popular with medical research in which the dependent variable is whether or not a patient has a disease. For a logistic regression, the predicted dependent variable is a function of the probability that a
